AGRADECIMENTOS

Agradeço aos meus pais, Jayme e Luiza por sempre me incentivarem e me apoiarem em minhas decisões, me fornecendo todo tipo de suporte para concretizar meus projetos e sonhos, dentre eles, o mestrado.

Aos meus irmãos, João André e Gustavo por me ajudarem a progredir nos caminhos escolhidos, seja por meio de conselhos ou por meio de força, me encorajando a evoluir.

Aos meus avós, por me proporcionarem vivências e condições de estudo que me permitiram chegar até aqui.

A minha namorada, Patrícia, pelo apoio, incentivo e companheirismo, além da grande ajuda que me deu durante todos os experimentos que fui responsável por conduzir no Aviário de Ensino e Pesquisa.

Ao professor Sergio Luiz Vieira por todas as oportunidades que me possibilitou, pela orientação, pela confiança e pelos ensinamentos.

Aos colegas do Aviário de Ensino e Pesquisa durante os 6 anos que estive no setor, entre estágio e mestrado, por toda a dedicação e comprometimento com as atividades, além da grande amizade que construímos nesse período. Em especial à Catarina Stefanello, pela grande ajuda que me deu durante todo esse período, sem ela a caminhada com certeza teria sido muito mais difícil.

Aos professores e funcionários do Programa de Pós-Graduação em Zootecnia - UFRGS. Ao CNPq pela bolsa de Mestrado e a Adisseo, pelo apoio financeiro na realização desse trabalho.

Ao senhor Jairo Padilha, pela ajuda nas batidas de ração e demais atividades dos experimentos conduzidos.

Enfim, agradeço a todos brasileiros por contribuírem com um pouco do seu tempo e trabalho para me proporcionar um ensino de qualidade. Espero poder dar o merecido retorno.

Muito obrigado!

SUPLEMENTAÇÃO DE UM COMPLEXO ENZIMÁTICO DE CARBOIDRASES EM DIETAS MILHO-SOJA PARA FRANGOS DE CORTE¹

Autor: Heitor Vieira Rios

Orientador: Sergio Luiz Vieira

Resumo – Objetivou-se avaliar o efeito da suplementação de um complexo enzimático, composto principalmente por endo 1,4 xilanase e endo 1,3(4) β -glucanases (CE), sobre o desempenho produtivo, a digestibilidade de aminoácidos (AA) e a utilização da energia em frangos de corte. Foram alojados 2.016 frangos de corte machos Cobb x Cobb 500 de um dia de idade em 72 boxes experimentais. As aves foram distribuídas em delineamento inteiramente casualizado com 9 tratamentos, 8 repetições e 28 aves por unidade experimental. Os tratamentos consistiram de uma dieta controle, formulada com níveis usuais de energia metabolizável aparente (EMA) e aminoácidos digestíveis (AA dig.) sem a inclusão do CE; e 8 dietas com reduções de EMA (-80 e -120 kcal/kg) e de AA dig. (-3% e 6%), suplementadas ou não com 50 mg/kg do CE. Foi utilizado um programa alimentar de 3 fases: inicial (1 a 21 d), crescimento (22 a 35 d) e final (36 a 42 d). Todas as dietas foram formuladas a base de milho e farelo de soja e com 1% de Celite, utilizado como indicador indigestível. Ganho de peso, consumo de ração e conversão alimentar corrigida para mortalidade (CA) foram avaliados aos 21, 35 e 42 d. Nos dias 21 e 42, 4 aves por unidade experimental foram sacrificadas para coleta de conteúdo ileal e posterior determinação da energia digestível ileal (EDI) e da digestibilidade de AA. Os dados foram submetidos à análise de variância e, quando significativas, as médias foram comparadas pelo teste de Student-Newman-Keuls a 5% de significância. Contrastes ortogonais foram realizados entre os tratamentos com reduções nutricionais com e sem adição do CE. Frangos alimentados com dietas com reduções de energia e de AA dig. sem a adição do CE apresentaram maior CA e menor EDI quando comparados aos frangos que receberam a suplementação do CE. A suplementação do CE nas dietas aumentou a digestibilidade total de AA aos 21 d, porém não houve efeito aos 42 dias. A maior liberação de energia proporcionada pelo CE foi observada aos 21 d em frangos de corte alimentados com dietas com -120 kcal/kg AME e -6% AA dig., sendo 5,8% maior quando comparados aos alimentados com a dieta análoga sem enzima. Conclui-se que a adição do CE melhorou o desempenho produtivo e resultou em aumento da digestibilidade de AA e do aproveitamento da energia em frangos de corte aos 21 e aos 42 d.

Palavras chave: carboidrases, frangos de corte, digestibilidade, energia, aminoácidos.

SUPPLEMENTATION OF A CARBOHYDRASES ENZYMATIC COMPLEX IN CORN-SOY BASED DIETS FOR BROILER CHICKENS¹

Author: Heitor Vieira Rios
Advisor: Sergio Luiz Vieira

Abstract - The objective of this study was to evaluate the effect of supplementation of an enzyme complex, composed of endo 1,4 xylanase and endo 1,3 (4) β -glucanases (EC), on the productive performance, amino acid digestibility (AA) and the use of energy in broilers. A total of 2,016 one-day-old Cobb x Cobb 500 male broilers were allocated in 72 floor pens. Chicks were distributed into 9 treatments with 8 replicates of 28 birds each in a completely randomized design. Treatments consisted of a control diet formulated with usual apparent metabolizable energy (AME) and nutrient levels without enzyme supplementation as well as 8 diets having reductions in formulated AME (-80 and -120 kcal/kg) and digestible amino acids (dig. AA; -3 and -6%) supplemented or not with 50 mg/kg of the supplemental enzyme complex. A 3 phases feeding program was used: Starter (1 to 21 d), Grower (22 to 35 d) and Finisher (36 to 42 d). All diets were corn-soybean meal based with 1% of Celite, used as marker. Body weight gain, feed intake and feed conversion corrected for the weight of dead birds (FCR) were evaluated at 21, 35 and 42 d. On days 21 and 42, four birds per experimental unit were sacrificed for ileal content collection and subsequent determination of ileal digestible energy (IDE) and AA digestibility. Data were submitted to analysis of variance and, when significant, the means were compared by the Student-Newman-Keuls test at 5% significance. Orthogonal contrasts were performed between treatments with nutritional reductions with and without EC addition. Diets with AME and dig. AA reductions without enzyme had higher FCR and lower IDE ($P < 0.05$). The supplemental enzyme increased total AA digestibility at 21 d; however, no effects were observed at 42 d. The highest energy improvement provided by the supplemental enzyme was observed at 21 d on broilers fed diets with -120 kcal/kg AME and -6% dig. AA, being 5.8% higher when compared to those fed the analogous diet without enzyme. Summarizing, the addition of EC led to improvements on growth performance, digestibility of AA and energy utilization on broilers at 21 and 42 d.

Key words: carbohydrase, broilers, digestibility, energy, amino acids.

CAPÍTULO I

INTRODUÇÃO

No Brasil, a maior parte das dietas para frangos de corte é constituída por milho e farelo de soja, sendo o milho o cereal responsável por aproximadamente 65% da energia (COWIESON, 2005), enquanto o farelo de soja fornece em torno de 80% da proteína bruta das rações (BAKER, 1996). Embora esses ingredientes apresentem alta digestibilidade para frangos de corte quando comparados com aveia, cevada e trigo, os quais são ingredientes comumente utilizados em dietas europeias, eles possuem alguns fatores antinutricionais em sua composição, como os polissacarídeos não amídicos (PNA) os quais dificultam a sua digestão por não ruminantes, visto que esses animais não possuem secreção endógena capazes de degradar estes componentes (BEDFORD, 1995; CHOCT, 1997; BACH KNUDSEN, 2014).

Os PNA são carboidratos estruturais que formam a parede celular dos vegetais e constituem a maior parte da fibra das dietas. Fazem parte dessa classe de polissacarídeos: hemiceluloses, celulosas e pectinas, os quais não podem ser completamente digeridos por não ruminantes, devido à natureza das suas ligações. São constituintes da parede celular dos ingredientes vegetais utilizados na formulação das dietas para frangos de corte, e por isso, nutrientes, amido, gordura e proteína ficam encapsulados dentro da matriz celular, o que impede que sejam digeridos e absorvidos pelas aves; efeito conhecido como *cage effect* (SIMON, 1998). Adicionalmente, alguns PNA são capazes de aumentar a viscosidade da digesta devido a sua propriedade hidrofílica, o que modifica a taxa de passagem do quimo, prejudica o acesso de enzimas endógenas aos seus respectivos substratos e dificulta o processo de digestão de ingredientes e de absorção de diversos nutrientes (BEDFORD, 1995; CHOCT, 1997; SLOMINSKI, 2011).

Enzimas exógenas, como as carboidrases, são capazes de hidrolisar frações de PNA presentes nas dietas, permitir a liberação de nutrientes encapsulados dentro da matriz celular e facilitar o acesso de enzimas endógenas ao seu substrato, mitigando os efeitos antinutricionais desses compostos. (BEDFORD, 2000). As carboidrases exógenas têm o potencial de otimizar a digestibilidade dos alimentos vegetais e, com isso, aumentar a absorção dos nutrientes e o aproveitamento da energia presentes nas dietas, podendo melhorar o desempenho produtivo das aves (OLUKOSI et al., 2008). Elas podem atuar na digestão de frações de ingredientes que não podem ser degradados por secreção endógena e/ou intensificar a atuação de enzimas endógenas.

A complexidade dos carboidratos de origem alimentar presentes no trato digestivo das aves, como as diferentes frações de PNA, criam a oportunidade de utilização de complexos enzimáticos capazes de atuarem nos diferentes constituintes da fibra alimentar (MENG & SLOMINSKI, 2005). Complexos de carboidrases, contendo xilanases e glucanases, podem degradar os xilanos e β -glucanos presentes na composição dos vegetais. Essas carboidrases possuem efeitos diretos, ao degradar os respectivos polissacarídeos e aumentar a energia digestível das dietas, e efeitos indiretos, pois podem liberar nutrientes aprisionados na matriz dos vegetais, diminuir a viscosidade da digesta, facilitando o acesso de nutrientes ao enterócito e auxiliar na atuação de enzimas endógenas (ADEOLA & COWIESON, 2011).

A utilização das enzimas exógenas visa melhorar o aproveitamento

dos nutrientes presentes na dieta e o desempenho produtivo dos animais. O efeito de carboidrases exógenas sobre a utilização de AA pode ocorrer devido a dois fatores principais: por meio da liberação de AA encapsulados na matriz celular dos vegetais e consequente aumento da absorção de AA (RUTHERFURD et al., 2007), e por meio da diminuição das perdas endógenas, visto que a adição de enzimas exógenas diminui a secreção de enzimas endógenas e, dessa forma, há um aumento do aproveitamento dos AA (COWIESON & RAVINDRAN, 2008a).

Para que se possa atender os objetivos da produção, é necessário o entendimento das potencialidades e limitações do uso das enzimas exógenas. Sabe-se que animais alimentados com dietas formuladas com níveis marginais de nutrientes são mais sensíveis aos potenciais benefícios das enzimas exógenas, se comparados aos animais alimentados com dietas que atendam ou excedam as suas exigências. Fato que pode ser explicado devido à essas dietas possuírem maior oportunidades para incrementos no desempenho e na digestibilidade em frangos de corte. A idade das aves é outro fator a ser observado quando se utilizam enzimas exógenas nas formulações. Animais jovens estão menos adaptados aos substratos hidrofílicos presentes nos alimentos, e por isso, a suplementação enzimática pode apresentar melhores resultados na fase inicial de vida das aves (RAVINDRAN, 2013).

Informações sobre um aditivo capaz de aumentar a absorção de nutrientes, a utilização da energia e o desempenho produtivo de frangos de corte, se tornam interessantes e promissoras para a avicultura. Muitas pesquisas acerca da utilização de carboidrases em dietas para frangos de corte contendo ingredientes viscosos tais como: o trigo, aveia e a cevada, estão disponíveis na literatura (KOCHER et al 2003; RUTHERFURD et al., 2007; LEE et al., 2010; AVILA et al., 2012). Entretanto, os efeitos da suplementação de complexos enzimáticos em dietas formuladas com ingredientes considerados de alta digestibilidade, como o milho e o farelo de soja ou dietas contendo níveis marginais de energia e AA, ainda carecem de informações. Sendo assim, objetivou-se com esse estudo, fornecer dados relevantes para maior entendimento sobre a utilização de um complexo enzimático, composto por carboidrases, em dietas milho-soja para frangos de corte.

REVISÃO BIBLIOGRÁFICA

Milho e farelo de soja em rações para frangos de corte

O milho e o farelo de soja são os principais ingredientes utilizados nas rações para frangos de corte no Brasil. O milho é a principal fonte de energia das rações para frangos de corte em todo o mundo (GEHRING et al., 2013), enquanto o farelo de soja é a principal fonte de proteína das dietas (BAKER, 1996). O principal carboidrato de reserva do milho é o amido, representando aproximadamente 60% do cereal, o qual é o maior contribuinte da energia das rações. Embora esse cereal possua baixos teores de proteína bruta (aproximadamente 8%) em comparação ao trigo e a cevada (cerca de 11%), ele é responsável por fornecer em torno de 20% do total da proteína presente nas rações para frangos de corte (COWIESON, 2005). No entanto, de acordo com Peter et al. (2000) o balanço de AA da proteína do milho é considerado pobre para aves, possuindo baixos teores de AA essenciais, como de lisina e de triptofano.

A soja *in natura* possui diversos fatores antinutricionais, como os inibidores de tripsina, e por isso necessita de um tratamento térmico adequado para que o seu farelo possa ser utilizado na ração animal. O fator crítico da qualidade do farelo ocorre devido a temperatura de processamento da soja, visto que temperaturas baixas não são capazes de eliminar a ação dos inibidores de proteases, e temperaturas excessivas provocam a reação de *Maillard*, a qual reduz o valor nutricional do alimento (GONZÁLEZ-VEGA et al., 2014). O farelo de soja possui altas concentrações de proteína bruta em sua composição, com um excelente perfil de AA que, após o processamento adequado, são altamente digestíveis para não ruminantes.

Apesar do alto valor nutritivo do milho e do farelo de soja para aves, muitos nutrientes presentes nesses vegetais não podem ser aproveitados por não ruminantes devido à presença de fatores antinutricionais, como os PNA. Segundo Bach Knudsen (2014) podem ser encontrados cerca de 9% desses compostos no milho e 21% no farelo de soja.

Polissacarídeos não amídicos

Os polissacarídeos não amídicos são carboidratos estruturais da parede vegetal dos grãos. Fazem parte dessa classe de polissacarídeos a hemicelulose, a celulose e as pectinas, as quais não podem ser completamente digeridas por não ruminantes devido a natureza das suas ligações. Consequentemente, nutrientes, tais como: amido, gordura e proteína, podem ficar encapsulados dentro da matriz celular, o que impede que sejam digeridos e absorvidos pelas aves, efeito conhecido como *age effect* (SIMON, 1998).

Devido a sua natureza hidrofílica, os PNA podem aumentar a viscosidade da digesta e alterar a taxa de passagem do quimo no trato gastrointestinal, interferindo no processo de digestão e absorção nutrientes, por impedir o acesso de enzimas aos seus respectivos substratos e por dificultar que os produtos da digestão cheguem aos enterócitos (BEDFORD, 1995; CHOCT, 1997). Por intreferirem no aproveitamento de nutrientes das dietas, esses fatores antinutricionais podem prejudicar o desempenho produtivo das aves, causando perdas à produção (OLUKOSI et al., 2008).

Os PNAs podem ser encontrados em quantidades variáveis nos vegetais, podendo representar um importante fator antinutricional. A quantidade e a composição de PNA presentes nos grãos pode variar devido a fatores genéticos como o cultivar utilizado, e a fatores ambientais tais como: as condições climáticas do local onde o grão foi cultivado e o grau de seu processamento (CHOCT, 1997; BACH KNUDSEN, 2014).

Cereais viscosos, como aveia e cevada, possuem quantidade de fibra maior que o milho e que o farelo de soja, no entanto, os últimos possuem quantidade suficiente para causar prejuízos ao processo de digestão e absorção das aves (SLOMINSKI, 2011). Segundo Bach Knudsen (2014) o milho possui 9% de PNA em sua composição, sendo cerca de 4% arabinosilanos, os quais são compostos por arabinoses e xiloses. De acordo com o mesmo autor o conteúdo de PNA presente no farelo de soja seria de 21%, e o conteúdo de arabinosilanos cerca de 4%. Em contrapartida, Malathi & Devegowda (2001) reportaram valores de 9,3% de PNA totais no milho, sendo 5,3% arabinosilanos. Segundo os mesmos autores a quantidade de PNA totais no farelo de soja seria de 29%, sendo o conteúdo celulose, pectina e arabinosilanos 5,2%, 6,2% e 4,2%, respectivamente.

Fatores antinutricionais, como os PNA, presentes no milho e no farelo de soja podem ser reduzidos com a utilização de enzimas exógenas capazes de hidrolisarem esses compostos em açúcares simples, eliminando os efeitos deletérios da fibra alimentar e promovendo melhorias no processo digestivo e absorptivo das aves. As carboidrases incluídas na alimentação tem demonstrado melhorar o desempenho produtivo e aumentar a digestibilidade dessas dietas por frangos de corte (ADEOLA & COWIESON, 2011).

Carboidrases exógenas

As carboidrases são enzimas capazes de degradar os carboidratos presentes no trato gastrointestinal. Por serem específicas ao substrato que atuam, elas existem em ampla variedade na natureza, como exemplo: amilases, pectinases, β -glucanases, xilanases, celulases, as quais atuam sobre: amido, pectinas, β -glucanos, xilanos, celulose, respectivamente.

As carboidrases exógenas utilizados como aditivos na alimentação animal são produzidas geralmente por fungos e bactérias, os quais viabilizam a obtenção desse produto de forma eficiente e produtiva. Avanços na área de biotecnologia proporcionam a produção de enzimas exógenas em escala e cada vez mais eficientes, tornando viável as suas utilizações na avicultura industrial.

A suplementação de carboidrases exógenas nas dietas para frangos de corte se justifica por dois motivos principais: potencializar a ação de enzimas endógenas e fornecer enzimas que o animal não produz de forma endógena. Para Bedford (1995), os efeitos positivos observados sobre o desempenho produtivo e a digestibilidade de nutrientes ocorrem devido à diminuição da viscosidade da digesta promovidas pela atuação das carboidrases sobre PNA, o que resultaria em uma maior eficiência digestiva e absorptiva pela ave.

De acordo com Bedford (2000) as razões principais para utilização dessa ferramenta seriam: aumentar o valor nutricional dos ingredientes, diminuindo inclusão de matérias primas de maior valor como o óleo e, portanto, reduzindo o custo das rações e diminuir os efeitos que a variação da composição nutricional dos ingredientes pode causar no desempenho zootécnico de frangos

de corte. O efeito da suplementação enzimática é maior em alimentos de baixa digestibilidade, pois neles há uma maior oportunidade de melhora na sua digestibilidade se utilizada a estratégia de suplementação enzimática apropriada. Neste contexto, as carboidrases compreendem uma gama de enzimas que podem ser suplementadas às rações com o objetivo de melhorar o aproveitamento da energia e a digestibilidade de nutrientes.

Carboidrases que atuam sobre os PNA, como xilanases e glucanases, podem melhorar o desempenho de frangos de corte, por serem capazes atuar na fibra presente nos ingredientes vegetais, as quais não são hidrolisadas de forma eficiente pelas aves, e por auxiliar no processo de digestão e de absorção de nutrientes, incrementando o uso da energia dos animais (CHOCT, 2006; OLUKOSI et al., 2008). Entretanto, é necessário o conhecimento sobre as limitações e potencialidades das enzimas, objetivando empregar a melhor estratégia possível para que os objetivos de produção pretendidos sejam atingidos de forma satisfatória (COWIESON, 2010).

Fatores relevantes quando na utilização carboidrases exógenas

O conhecimento do mecanismo de ação das carboidrases é necessário para que a enzima possa promover melhorias ao desempenho animal. Nesse sentido, a compreensão de aspectos relacionados a enzimologia tornam-se de suma importância para aplicar a melhor estratégia, visando atingir o máximo potencial da ferramenta e possibilitar que os objetivos de produção sejam atendidos.

As enzimas são moléculas protéicas que catalisam reações de alta especificidade, atuando em substratos específicos. Elas são ativadas quando se encontram em condições de umidade, temperatura e pH favoráveis e necessitam manter a sua configuração intacta para poderem catalisar reações químicas, (LEHNINGER, 2000). Visto que enzimas são proteínas capazes de aumentar a velocidade das reações químicas, gerando um determinado produto a partir de um substrato específico, é primordial que o último esteja presente na dieta em quantidades que possibilitem a atividade enzimática.

Sabe-se que as respostas à suplementação enzimática são mais evidentes quando utilizados alimentos de baixo valor nutricional (BEDFORD, 2000). Pesquisas sobre a utilização de carboidrases em dietas para frangos de corte alimentados com ingredientes pouco digestíveis (quando comparados ao milho e ao farelo de soja), tais como: trigo, aveia, cevada, canola e resíduos secos de destilaria contendo solúveis estão disponíveis na literatura, demonstrando a eficiência dessas enzimas sobre os substratos presentes nesses ingredientes (KOCHER et al 2003; RUTHERFURD et al., 2007; LEE et al., 2010; AVILA et al., 2012; BAREKETAIN et al., 2013; KACZMAREK et al., 2014). Não obstante, trabalhos avaliando o efeito de carboidrases suplementadas em dietas milho-soja ainda são escassos e muitas vezes apresentam respostas variáveis. Como exemplo, o estudo de Yegani & Korver (2013), avaliando o efeito de diferentes carboidrases em dietas milho-soja, utilizando milhos de diferentes origens, sobre a energia digestível ileal (EDI), digestibilidade ileal da proteína bruta e de AA nas diferentes fases de vida de frangos de corte, observaram resultados inconsistentes e variáveis dependendo da origem do milho, do produto enzimático utilizado e da idade das aves. Segundo os autores, os resultados inconsistentes encontrados podem ter

ocorrido devido a diversos fatores, tais como: tipo, quantidade e mecanismo de ação das enzimas usadas; estratégia de utilização dos produtos; e qualidade nutricional e forma física das rações.

Após serem suplementadas nas rações, a eficiência das carboidrases depende de diversos fatores para promoverem os efeitos desejados, logo, os resultados sobre o desempenho e o aproveitamento de energia e de nutrientes possuem uma grande variabilidade, pois dependem das características e do mecanismo de atuação das enzimas, da composição dos ingredientes e dos fatores fisiológicos e digestivos das aves (RAVINDRAN, 2013). O mesmo autor suporta que o pouco tempo disponível para as enzimas atuarem sobre o seu substrato é um fator limitante da eficiência das enzimas exógenas, uma vez que a taxa de passagem da digesta é relativamente rápida em aves e que grande parte das enzimas são desnaturadas pelo baixo pH do proventrículo ou degradadas por proteases endógenas, como a pepsina e a tripsina.

Dietas formuladas com níveis nutricionais marginais para frangos de corte apresentam maior oportunidade de aumento na digestibilidade de nutrientes quando adicionado enzimas exógenas quando comparadas a dietas que tenham níveis nutricionais adequados às exigências das aves (RAVINDRAN, 2013). É provável que a redução dos níveis de EMA e AA dig. aumentem os substratos para atuação das carboidrases, pois a diminuição desses níveis implicam em menor quantidade de óleo nas dietas, e conseqüentemente maior espaço para a inclusão de grãos, os quais possuem em sua composição quantidades significativas de PNA. Em um estudo avaliando o efeito da suplementação de um complexo enzimático composto por protease, xilanase e amilase em uma dieta formulada com níveis nutricionais usuais e em outra formulada com -150 kcal/kg de EMA e -3% AA dig, Cowieson & Ravindran (2008b) observaram maiores incrementos em EMA, EDI e digestibilidade de AA devido a adição do produto enzimático na dieta com menor nível nutricional quando comparado a dieta controle. Em estudo similar, West et al (2007) não observaram melhora significativa no desempenho produtivo de frangos de corte com a adição de um complexo enzimático contendo xilanases e glucanases, mesmo quando os frangos foram alimentados com dietas com reduções de 66 kcal/kg de EMA e de 2,5% de AA essenciais, possivelmente porque os níveis utilizados na formulação da dieta para ser marginal em EMA e AA foi suficiente para atender a exigência das aves.

De acordo com Olukosi et al. (2007), a idade das aves é um fator relevante para ser observado. Para os autores, é provável que frangos de corte respondam melhor aos potenciais efeitos das enzimas exógenas quando jovens, devido a baixa secreção de enzimas endógenas causada pela imaturidade de seu sistema digestivo, o qual está ainda adaptado a substratos lipídicos e não ainda aos hidrofílicos presentes nas dietas. Leslie et al. (2007), adicionando uma glucanase em dietas para frangos de corte verificaram uma melhora de 3,5% na energia digestível ileal em aves aos 9 dias de vida, enquanto um aumento de 2,4% foi reportado para frangos aos 23 dias.

Segundo Acamovic & McCleary (1996) aspectos envolvendo: as condições fisiológicas do animal, como a sua temperatura corporal, o tamanho do trato gastrointestinal das aves, a atuação de enzimas endógenas sobre as exógenas, a concentração da enzima exógena em relação a quantidade de substrato, e as características dos alimentos presentes na dieta, seriam fatores

relevantes a serem considerados quando no uso dessa ferramenta. Em parte, esses aspectos podem explicar porque muitos estudos avaliando a eficiência da suplementação de carboidrases em dietas para frangos de corte não indicaram efeitos significativos sobre os parâmetros produtivos e/ou de digestibilidade.

Strada et al. (2005) não observaram efeitos significativos no desempenho produtivo de frangos de corte que receberam um complexo enzimático, composto por protease, amilase e xilanase, em dietas formuladas com sorgo, milho e farelo de soja ou em dietas milho-soja. Em corroboração, Olukosi et al. (2007) também não encontraram efeitos da adição de um produto contendo xilanase, amilase e protease sobre o desempenho zootécnico de frangos de corte, entretanto, os autores observaram que a digestibilidade de P foi maior para tratamentos com a inclusão das enzimas.

Stefanello et al. (2016), verificaram que a adição de níveis crescentes de uma xilanase (0, 50, 100, 150 e 200 FXU/kg) em dietas milho-soja melhorou a digestibilidade de nutrientes e o uso de energia em frangos de corte, contudo os melhores resultados só foram obtidos quando 200 FXU/kg foi incluído às rações, verificando-se a melhora de 6,1% na EDI e na energia metabolizável aparente (EMA) das aves, em relação ao controle negativo. Gracia (2013) verificou maior digestibilidade de nutrientes e melhora de 2,3% na EMA em frangos de corte quando adicionada uma amilase mono componente em rações milho-soja.

Os ingredientes vegetais utilizados na formulação das rações para frangos de corte possuem uma grande variedade de PNA em sua composição, o que torna viável a inclusão de diferentes carboidrases às dietas (BACH KNUDSEN, 2014). Segundo Cowieson (2010), é improvável que haja um efeito aditivo das enzimas quando incluídas em conjunto às rações, pois as frações indigestíveis do alimento diminuem à medida que uma nova enzima é adicionada, o que reduz as possibilidades de atuação de outra enzima. Não obstante, os mesmos autores afirmam que um efeito subaditivo com a suplementação de enzimas exógenas pode ser observado.

Em um estudo utilizando diferentes carboidrases em rações milho-soja para frangos de corte, Tahir et al. (2006) não encontrou melhora significativa na digestibilidade de proteína bruta e no uso da energia quando adicionadas pectinase, celulase ou hemicelulase nas rações de frangos de corte de forma isolada, contudo foi observado melhora nas variáveis supracitadas quando as enzimas foram adicionadas em conjunto nas dietas. Em corroboração a esses resultados, Meng & Slominski (2005) suportam que a complexidade dos carboidratos de origem alimentar presentes no trato digestivo das aves, como as diferentes frações de PNA, criam a oportunidade de utilização de variadas carboidrases e de complexos enzimáticos capazes de atuarem nos diferentes constituintes da fibra alimentar.

Uso de complexos enzimáticos, contendo carboidrases, em dietas para frangos de corte

A utilização de complexos enzimáticos pode ser uma estratégia eficaz para atender os objetivos de produção, visto que as enzimas são altamente específicas para o substrato em que atuam e que uma grande variedade de PNA é encontrada formando a parede celular dos vegetais. Nesse sentido, é possível

encontrar complexos enzimáticos compostos por diferentes enzimas e apresentando variadas respostas.

Em um estudo avaliando a inclusão de um complexo enzimático contendo amilase, xilanase e protease, Zanella (1999) observou que a suplementação enzimática melhorou o desempenho zootécnico de frangos de corte e diminuiu a síntese de enzimas endógenas, o que pode ter possibilitado, segundo o autor, uma maior eficiência energética no processo de digestão, permitindo que mais energia fosse destinada ao crescimento das aves. Cowieson & Adeola (2005), em um estudo em frangos de corte recebendo um produto enzimático contendo xilanase, amilase e protease na dieta, observaram aumento do valor nutritivo de dietas à base de milho e farelo de soja, sugerindo que o efeito possa ter ocorrido devido a atuação dessas enzimas sobre a parede celular dos grãos.

Em estudo avaliando os efeitos de um complexo de carboidrases composto por xilanase, pectinase, glucanase, celulase, mananase e galactanase em rações milho-soja, Meng & Slominski (2005) observaram um aumento de 2,3% na energia metabolizável em frangos de corte. Dados encontrados por Cowieson & Ravindran (2008b) demonstraram que a utilização de um complexo enzimático composto por xilanase, amilase e protease, foi capaz de aumentar a energia metabolizável das dietas em 2,8%, além de melhorar a digestibilidade de AA, em frangos de corte alimentados com dietas milho-soja.

A utilização de enzimas exógenas permite a melhora na utilização dos AA pelas aves. O efeito de carboidrases exógenas sobre a utilização de AA pode ocorrer devido a dois fatores principais: por meio da liberação de AA encapsulados na matriz celular dos vegetais e consequente aumento da absorção de AA (RUTHERFURD et al., 2007); e por meio da diminuição das perdas endógenas, visto que a adição de enzimas exógenas diminui a secreção de enzimas endógenas e, dessa forma, há um aumento do aproveitamento dos AA (COWIESON & RAVINDRAN, 2008a).

Em um experimento adicionando um complexo enzimático com atividades de protease, xilanase e amilase em dietas à base de milho para frangos de corte, Cowieson & Ravindran (2008b) reportaram aumento na digestibilidade de AA, quando suplementado o produto enzimático, sendo os maiores incrementos observados nos AA: Cys (9,1%), Thr (5,2%) e Ala (4,5%). Os mesmos autores não observaram efeitos da suplementação enzimática na digestibilidade de Met, provavelmente por utilizarem na formulação das rações a forma cristalina desse AA, a qual possui elevada digestibilidade. Em estudo similar, Zanella et al. (1999) observaram maiores incrementos na digestibilidade de Thr (3,0%) e Val (2,3%) suplementando um complexo enzimático contendo protease, xilanase e amilase em dietas milho-soja para frangos de corte, não verificando efeito do produto enzimático na digestibilidade de Lys e Met. Em corroboração aos estudos anteriores Rutherford et al. (2007) observaram aumento na digestibilidade de AA, em frangos alimentados com dietas milho-soja contendo trigo e farelo de canola, suplementadas com um complexo enzimático composto por glucanases e xilanases, entretando esses autores, diferentemente dos demais supracitados, observaram melhora na digestibilidade de Met (3.3%).

Complexos de carboidrases, contendo xilanases e glucanases, podem degradar os xilanos e os β -glucanos presentes na composição dos

vegetais. As enzimas xilanase e glucanase são praticamente ausentes no trato gastrointestinal de monogástricos, enquanto que seus respectivos substratos, arabinoxilanos e glucanos, estão presentes em relativa abundância nas rações (BEDFORD & SHULZE, 1998). Fernandes et al. (2016) observaram melhora no ganho de peso e na conversão alimentar de frangos de corte, e maior energia metabolizável aparente das dietas quando um complexo xilanase-glucanase foi suplementado em dietas para frangos de corte à base de sorgo e farelo de soja. Em contrapartida, West et al. (2007) não verificou nenhuma efeito na adição dessas enzimas sobre o desempenho produtivo de frangos de corte em dietas à base de milho e farelo de soja

O emprego de programas enzimáticos objetivando a hidrólise das variadas frações indigestíveis dos alimentos pode ser uma estratégia eficaz para otimizar o aproveitamento dos nutrientes presentes nas rações de frangos de corte, melhorar o desempenho zootécnico dos animais e reduzir o custo da alimentação animal. Adicionalmente, os recentes avanços na área de biotecnologia tornam possíveis novas perspectivas de estudo e de atuação das enzima exógenas. Sendo assim, maiores entendimentos sobre os benefícios e limitações da utilização de complexos de carboidrases em dietas para frangos de corte, principalmente quando formuladas com ingredientes de alta digestibilidade, são de grande valia para a avicultura.

HIPÓTESES E OBJETIVOS

Hipóteses

Frangos de corte alimentados com dietas contendo um complexo enzimático composto principalmente por glucanases e xilanases possuem desempenho produtivo similar aos que recebem dietas não suplementadas.

Frangos de corte alimentados com dietas suplementadas com um complexo enzimático composto principalmente por glucanases e xilanases apresentam digestibilidade de AA maior quando comparados aos que recebem dietas não suplementadas.

A utilização de energia é influenciada quando frangos de corte são alimentados com dietas suplementadas com um complexo enzimático composto principalmente por glucanases e xilanases em relação aos que recebem dietas não suplementadas.

Objetivos

Avaliar os efeitos da suplementação de um complexo enzimático, composto principalmente por endo 1,4 xilanase e endo 1,3(4) β -glucanases em dietas milho-farelo de soja formuladas com reduções de energia metabolizável aparente e de AA digestíveis para frangos de corte

Avaliar os efeitos da suplementação do complexo enzimático sobre o desempenho produtivo, sobre a energia digestível ileal e sobre a digestibilidade ileal da matéria seca e de AA em frangos de corte aos 21 e 42 dias de idade.

SUMMARY

A study was conducted to evaluate the effects of supplementing corn-soy diets with a commercial xylanase- β -glucanase complex [β -xylanase, 1,3(4)- β -glucanase, and 1,4- β -glucanase] on growth performance and ileal digestibility of broiler chickens. A total of 2,016 Cobb x Cobb 500 1-d-old male chicks were distributed into 9 treatments with 8 replicates of 28 birds each in a completely randomized design. Treatments consisted of a control diet formulated with AME and nutrient levels without enzyme supplementation as well as 8 diets having reductions in formulated AME (-80 and -120 kcal/kg) and digestible amino acids (dig. AA; -3 and -6%) supplemented or not with 50 mg/kg of the supplemental enzyme complex. Ileal content were collected at 21 and 42 d to determine ileal digestible energy (IDE) and AA digestibility. Diets with AME and dig. AA reductions without enzyme had higher FCR and lower IDE ($P < 0.05$). The supplemental enzyme increased total AA digestibility at 21 d; however, no effects were observed at 42 d. The highest total AA digestibility was observed with the control diet whereas the supplemental enzyme could equate this level in nutritional reductions diets. The addition of 50 mg/kg of the xylanase- β -glucanase complex in corn-soy diets led to improvements in performance and ileal digestibility in broilers at 21 and 42 d. The highest energy improvement provided by the supplemental enzyme was observed at 21 d on broilers fed diets with -120 kcal/kg AME and -6% dig. AA, being 5.8% higher when compared to those fed the analogous diet without enzyme.

DESCRIPTION OF PROBLEM

Corn and soybean meal (**SBM**) based diets are routinely utilized worldwide to feed commercial poultry. In this type of diet, energy is mainly originated from corn (around 65% of the AME) [1], whereas SBM alone may add 80% of total diet CP [2]. Corn-soy diets are relatively more digestible in comparison to diets containing other cereals such as barley and wheat, which compared to corn, have much higher content of non-starch polysaccharides (**NSP**) [3]. Reduction in diet digestibility induced by NSP has been reported as related to their capacity to increase digesta viscosity [3, 4]. As constituents of cell walls, NSP also play roles in the encapsulation of nutrients in what is frequently referred as “cage effect” [3, 4, 5]. This is known to reduce energy as well as digestibility of nutrients, such as amino acids (**AA**) and lipids [6, 7].

The NSP content of corn and SBM varies with genetics and is also affected by the environment where it is cultivated [3, 8]. Regardless of variation content, valuable amounts of nutrients pass through the gastrointestinal tract without being totally digested in those diets [1, 9, 10]; therefore, supplementing poultry diets with exogenous enzymes targeting NSP has been frequently referred as an efficient tool to release energy and nutrients from them [9], which can potentially increase the value of low quality corn in broiler feeds and support adequate commercial live performance objectives [1].

The actual mechanism of action of the enzymes present in commercially available supplemental complexes depend on their ability to degrade the different substrates present in feed ingredients that are targeted by them. Total NSP has estimated at 9.7 and 21.7% in corn and SBM, respectively [11]. From all NSP present in corn, arabinoxylans are the ones having the highest content, corresponding to a level of 5% of corn total composition [11]. Xylan chain degradation by xylanases leads to an increase in AME; however, the

total AME increase is also due to a decrease in digesta viscosity and the release of encapsulated energy producing nutrients besides the monomeric absorption of xylans [4]. A common component of soluble NSP fractions, β -glucans are main contributors for the increased viscosity of diets having barley, rye and wheat [4]. Corn-soy diets, however, are low in β -glucan content with an estimation of 0.3% in a weight basis [12]. Benefits of supplemental multiple enzyme complexes having mixes of xylanases and β -glucanases have been reported even though β -glucanase effects alone have not been measured [13, 14].

Studies evaluating the effects of exogenous carbohydrases in the live performance of poultry as well as in nutrient digestibility have been published in increased quantities in the last years. A considerable amount of these studies, however, has been conducted with feeds having viscous cereals [15, 16, 17]. On the other hand, the interpretation of the results from studies with enzymatic complexes having carbohydrases has to be carefully done because ant performance improvement cannot be attributed to one single enzyme. However, these studies remain important to demonstrate the effectiveness of the action of several enzymes altogether, which is a very common practice in poultry nutrition. The objective of the present study was to provide additional information on the effect of all vegetable corn-SBM diets supplemented with a multiple enzyme complex, composed mainly by xylanase and β -glucanases. Growth performance as well as ileal digestibility of amino acids were evaluated in broiler chickens at 21 and 42 d.

MATERIALS AND METHODS

All procedures used in the present study were approved by the Ethics and Research Committee of the Federal University of Rio Grande do Sul, Porto Alegre, Brazil.

Experimental Facilities and Bird Husbandry

A total of 2,016 slow-feathering, Cobb × Cobb 500 one-day-old male chicks [18] ($45\text{g} \pm 1.0$), vaccinated for Marek's disease at the hatchery were randomly placed into 72 floor pens ($1.65 \times 1.65 \text{ m}^2$). Bedding material was rice hulls and pens were equipped with a 15 kg capacity tube feeder and 3 nipple drinkers. Birds had *ad libitum* access to water and mash feeds. Average temperature was 32°C at placement being reduced by 1°C every 2 d targeting comfort throughout the study with the use of thermostatically controlled heaters, fans and foggers. Lighting was continuous until 14 d of age, with a 14L:10D cycle used afterwards.

Experimental Design and Diets

Feed samples of each batch were taken and analyzed to ensure the presence of the enzymatic complex (**EC**) at the formulated content. A 3-phases feeding program was used as follow: starter (1 to 21 d), grower (22 to 35 d), and finisher (36 to 42 d) (Table 1 to 3). All diets were corn-SBM based and Celite [19] was added at 1% as an indigestible marker in the starter and finisher diets. Birds were allocated into 9 dietary treatments with 8 replications of 28 birds each in a completely randomized design.

Broilers were fed a control diet (**C**) as well as 8 other diets with reductions of AME and digestible AA (**dig. AA**). The C diet was formulated to meet or exceed requirements for each feeding phase [20]. Other 4 diets had reductions of AME and dig. AA when compared to C, without enzyme supplementation, as follow: reductions of 80 kcal/kg AME and 3% dig. AA; reductions of 80 kcal/kg AME and 6% dig. AA; reductions of 120 kcal/kg AME and 3% dig. AA, and reductions of 120 kcal/kg AME and 6% dig. AA. A group of treatments formulated as the ones with reduced AME and dig. AA was supplemented with 50 mg/kg of a multiple enzyme complex produced from *Talaromyces*

versatilis, which is composed by pectinases, cellulases, proteases and arabinofuranosidases [21]. The commercial product has registered activities of xylanase and β -glucanase respectively of 2,600 dinitrosalicylic acid (**DNS**) units and 1,800 DNS per g of product. A DNS unit of xylanase and β -glucanase is defined as the amount of enzyme that produces the equivalent of one μmol of glucose or xylose per minute from the substrate (xylan from birch wood or beta-glucan of barley, respectively) [22].

Measurements

Chicks were individually weighed and placed into groups of 28 per floor pen. Bird weights were averaged by pen and recorded at d 1, 21, 35, and 42. Body weight gain (**BWG**), feed intake (**FI**), and FCR corrected for the weight of dead birds were calculated from 1 to 21 d, 22 to 35 d, 36 to 42 d, and 1 to 42 d on a pen-basis. Mortality was recorded immediately after noticed. At 21 and 42 d, 4 birds were randomly taken from each pen and euthanized by cervical dislocation following electrical stunning at 45 V for 3 s. These birds were used for ileal digesta collection from Meckel's diverticulum to approximately 2 cm cranial to the ileo-cecal junction. Digesta was flushed with distilled water into plastic containers, pooled by pen, immediately frozen in liquid nitrogen, and stored in a freezer at -20°C until lyophilized. Diets as well as freeze-dried samples of ileal digesta were ground to pass a 0.5-mm grinder screen [23].

Chemical Analysis and Calculations

Dry matter analysis of samples was performed after oven drying the samples at 105°C for 16 h [24]. Ileal digesta samples were analyzed for gross energy (**GE**) using a calorimeter calibrated with benzoic acid as a standard [25]. Analyses of AA in ingredients and diets were conducted according to the method 914.12 using an HPLC auto analyzer and employed performic acid oxidation of the feed sample prior to acid hydrolysis [24].

Calculations of ileal digestibility of dry matter (**IDM**), ileal digestible energy (**IDE**) and dig. AA were done afterwards. Acid insoluble ash concentration in the diets and ileum samples were determined using the method described by Vogtmann et al. [26] and Choct and Annison [27]. Apparent ileal digestibility and AA digestibility were calculated using the following equations [28]:

Digestibility (%) = $[1 - (M_i/M_o) \times (E_o/E_i)] \times 100$, and IDE (kcal/kg) = $GE_i - [GE_o \times (M_i/M_o)]$, where M_i is the concentration of acid insoluble ash in the diet in grams per kg of DM; M_o is the concentration of acid insoluble ash in the ileal digesta in grams per kg of DM output; E_i is the concentration of DM, AA or energy, in the diet in milligrams per kg of DM; and E_o is the concentration of DM, AA or energy, in the ileal digesta in mg/kg of DM. GE_i is GE (kcal/kg) in the diet; GE_o is the GE (kcal/kg) in the ileum content.

Statistical Analysis

Statistical analyses were performed using SAS [29]. Data were submitted to an analysis of variance and when significant, had the means compared by Student-Newman-Keuls test [30] at 5% significance. Orthogonal contrast analyses was also conducted comparing treatments with and without the EC supplementation.

RESULTS AND DISCUSSION

Analyses of the EC added to experimental diets showed level activities in agreement with the expected formulated values (Table 4). Growth performance of broilers is presented in Table 5. Cumulative BWG from 1 to 42 d was not affected by the treatments, regardless of nutrient reductions and EC supplementation. Cumulative FCR from 1 to 42 d was higher when broilers were fed diets with 120 kcal/kg of reduction without EC supplementation compared to the C diet ($P < 0.05$); however, no differences

were observed when the C diet was compared to the treatments with EC supplementation. Birds fed treatments that had -120 kcal/kg AME and -3% dig. AA presented a decrease of 3.0% in FCR when diets were supplemented with the EC ($P < 0.05$) compared to those fed the analogous diet without EC. Diets formulated with -80 kcal/kg and -3% dig. AA resulted in lower FI ($P < 0.05$) when supplemented with EC for broiler from 1 to 42 d compared to the -120 kcal/kg and -6% dig. AA diets without supplementation.

The IDM and IDE at 21 and 42 d are presented in Table 6. The IDE at 21 and 42 d was higher ($P < 0.05$) when broilers were fed the C diet if compared to those fed diets with -120 kcal/kg without EC. The IDE at both ages was also increased ($P < 0.05$) when broilers were fed the -120 kcal/kg AME diet supplemented with the EC when compared to the analogous diets without EC. Estimations of IDE improvements due to EC supplementation occurred with diets formulated with -120 kcal/kg and -6 dig. AA being 5.8% higher for broilers at 21 d and 3.8% higher for birds at 42 d.

Amino acid digestibility at 21 and 42 d are presented in Tables 7 and 8, respectively. Total AA digestibility was higher at 21 d for birds fed the EC supplemented diets compared to those fed diets not supplemented ($P < 0.05$), nevertheless no difference was observed for birds at 42 d. Diets formulated with a reduction of 6% dig. AA and not supplemented with the EC had lower ($P < 0.05$) total AA digestibility at 21 d compared with the C diet; however, no difference was observed between the C and diets supplemented with EC. Indispensable AA digestibility at 21 d was lower for diets formulated with -6% dig. AA without EC, regardless the AME level when compared to the C diet ($P < 0.05$). Additionally, the ileal digestibility of Arg, Ile, Phe, Thr and Val was similar in the C diet and diets supplemented with the EC. Digestibility of Arg, Ile and Val at 42 d was higher in the C diet when compared to diets with -6% dig. AA and

without EC supplementation ($P < 0.05$), while the ileal digestibility of dispensable AA was not influenced by enzyme supplementation, energy and AA levels.

Contrasts between treatments with energy and AA reductions supplemented with EC against those not supplemented are shown in Tables 5 to 8. Contrasts among all diets with AME and dig. AA reduction with and without EC supplementation did not differ statistically on cumulative FI; however, birds fed diets with EC supplementation showed a decrease of 1.9% ($P < 0.05$) on cumulative FCR. The IDM at 21 and 42 d increased ($P < 0.05$) when diets were supplemented with the EC. Contrasts between treatments with -120 kcal/kg at 21 d showed IDE improvements of 5.8% ($P < 0.05$) when the EC was supplemented, whereas at 42 d, contrasts between diets with -120 kcal/kg showed increases of 3.3 and 3.8% ($P < 0.05$) on IDE for birds fed -3% dig. AA and -6% dig. AA, respectively, when supplemented with the EC. When comparing all diets with AME and dig. AA reduction with and without EC supplementation the IDE improvement by the EC at 21 d and 42 d was 4.3 vs. 2.6%, respectively. For instance, increases in digestibility of first limiting AA at 21 d were of 1.4% for Lys, 2.4% for Thr and 2.1% for Val, however Met was not influenced by treatments.

Contrasts among all diets with AME and dig. AA reduction with and without EC supplementation at 21 d showed improvements ($P < 0.05$) for the indispensable AA: Arg (1.2%), Ile (1.6%), Leu (1.4%), Lys (1.4%), Phe (1.5%), Thr (2.4%) and Val (2.1%), when EC was supplemented, however no EC effect was observed for Met and His ($P > 0.05$). For dispensable AA, was observed improvements with EC supplementation for Ala (1.6%), Glu (1.3%) and Ser (1.9%), and no effect for Asp, Cys and Gly ($P > 0.05$). The same contrast for birds at 42 d indicated no effect for any indispensable or dispensable AA digestibility with the EC supplementation ($P > 0.05$).

Some authors attribute improvements on AA digestibility obtained with exogenous carbohydrases by modifications in the secretions of endogenous enzymes as well as in the intestinal microbial environment [3, 9, 31]. The greatest improvements on AA digestibility due to EC supplementation at 21 d was observed for Thr (2.4%), Val (2.1%) and Ser (1.9%), but no responses were observed on Met, Gly and His. An intermediate effect was observed on Lys (1.4%). Cowieson and Ravindran [31] reported relevant improvements in the digestibility of Cys (9.1%), Thr (5.2%) and Ala (4.5%) when a multiple enzyme complex containing protease, xylanase and amylase was added to corn-based diets. The same authors did not observe effects of the supplemental enzyme on Met digestibility. Zanella et al [38] observed significant increase in the digestibility of indispensable AA Thr (3.0%) and Val (2.3%) supplementing a mix of amylase, xylanase and protease in corn-soy diets; however, no improvements were detected in Lys and Met. Rutherford et al. [16] observed improvements on AA digestibility on birds fed corn-soy diets containing wheat bran and canola meal, supplemented with a commercial product compound by amylase, β -glucanase and xylanase, although, differently from the present study, improvements in Gly (9.3%), Asp (8.4%) and Met (3.3%) were also observed. The same authors support that the improvements observed in AA digestibility due to supplemental enzymes are actual effects of protein hydrolysis and absorption of AA. According to Cowieson and Ravindran [39] it is likely that the mechanisms that actually improved AA utilization using exogenous enzymes are related to a reduction of endogenous losses due to a reduced secretion of endogenous enzymes, and not only by an improvement on the digestibility itself.

The improvements obtained with the EC supplementation on DM digestibility in the present study support the reduced FCR observed when EC was supplemented in

comparison to the non supplemented diets; maybe because the higher digestibility of all nutrients at dry matter base due to the EC supplementation could made birds regulate their FI, since bird's nutrient requirement was reached with less feed consumed.

The significative improvements of the EC on growth performance observed on birds fed the lowest nutritional diets are in agreement with research done by Cowieson and Adeola [7], who observed that a positive effect of exogenous carbohydrases would be more pronounced in diets with marginal nutrient levels, probably because there would be a larger room for enzyme improvements. In a similar study, West et al. [32] did not observe any effect of a xylanase- β -glucanase complex on growth performance of broilers fed corn-SBM based diets, presumably, because the nutrient levels of the treatments formulated to be marginal in AME and dig. AA were high enough to achieve birds' requirements. Additionally, research done by Muniaka et al. [33] indicate that feeds formulated with high digestible ingredients, such as corn and SBM, are less responsive to exogenous carbohydrases than when utilized barley, wheat and rye. In the present research, the EC provided higher improvements on AA digestibility and IDE on birds at 21 d than at 42 d, suggesting that young birds are less capable of digest the NSP present on diets [34]. This agrees with research done by Leslie et al. [35], who observed higher improvements on nutritional value of diets provided by a glucanase in 9-d-old birds than in 23-d-old birds. However, Yegani and Korver [36], using a product containing xylanase and β -glucanase, observed improvements on IDE in the grower diets, despite no improvement was noted in starter and finisher diets.

In the current study, improvements in growth performance, IDE and dig. AA were observed when broilers were fed corn-SBM basal diets with EC supplementation; however, some authors have not observed improvements on bird performance when

adding supplemental enzymes [32, 37]. It is possible that the increased digestibility of energy and AA observed with the EC in the present research, led to improvements on FCR of birds, due to a better nutrient utilization. As expected, enzymes have active site specification, and therefore, the benefit obtained with the use of added supplemental enzymes can be only achieved if it is able to reach that site. The complexity of dietary carbohydrates present an opportunity to use enzymatic complexes with different enzyme activities. Although the EC utilized in the present study had registered activities of xylanases and β -glucanases, it also has producer guaranteed activities of other enzymes, such as cellulases, pectinases and proteases [21]. Even though these activities are of proportionally lower impact than the xylanase and β -glucanase, their effect cannot be totally underestimated. Therefore, the findings obtained in the present study have to be directed to the whole mix of enzymes present in the commercially available product and, unfortunately, do not allow any estimation of benefits from individual enzymes. Studies with enzyme blends have shown benefits, both in live performance as well as with specific improvements in the digestibility of nutrients, such as AA [13, 14, 15, 16, 17, 31, 38, 39, 40, 41]. An adequate comparison of the expected improvements when using blends or complexes obviously depends on the ingredients utilized in the formulated feed as well as on the type and activities of enzymes present in them such that a cost-benefit decision can be made.

CONCLUSIONS AND APPLICATIONS

1. The supplementation of a supplemental enzyme complex having registered activities of xylanases and β -glucanases, but also with minor activities of cellulases, pectinases and proteases, led to improvements in FCR, IDE and dig. AA of broiler chickens.

2. Increased energy utilization when using the enzyme complex corresponded to an uplift on the ileal digestible energy such that a diet formulated with reduction in 120 kcal/kg produced similar values as those obtained with a Control diet without energy reduction.
3. Digestibility benefits with the use of the supplemental enzyme complex were higher for broilers at 21 d when compared to those at 42 d; ileal digestible energy improvements were 4.4% and 2.6%, respectively at those ages.
4. Increased digestibility of AA at 21 d were obtained with the use of the the enzyme complex on most of dispensable and indispensable amino acids; the highest improvements were observed with Thr (2.4%), Val (2.1%) and Ser (1.9%).

CAPÍTULO III

CONSIDERAÇÕES FINAIS

O presente trabalho reporta que a utilização de um complexo enzimático melhorou a conversão alimentar, a digestibilidade de AA e o aproveitamento da energia de frangos de corte alimentados com dietas milho-soja deficientes em energia e em aminoácidos digestíveis. A utilização do complexo enzimático composto por endo 1,4 xilanase e endo 1,3(4) β -glucanases pode ser uma estratégia eficaz para diminuir custos de produção da indústria avícola.

Foi possível observar que os frangos na fase inicial foram mais sensíveis às melhorias promovidas pela suplementação do complexo enzimático sobre o aproveitamento da energia e digestibilidade de AA do que na fase final. Acredita-se que isto pode ter ocorrido porque as aves jovens ainda não estejam completamente adaptadas aos ingredientes presentes nas rações, e as enzimas exógenas tenham auxiliado no processo digestivo dos animais.

Foi verificado que os aumentos na digestibilidade de AA, na utilização de energia e no desempenho zootécnico foram maiores em frangos alimentados com os menores níveis nutricionais quando suplementado o complexo enzimático em suas dietas. Sendo assim, é provável que os efeitos do produto enzimático utilizado seja mais visível em dietas com níveis nutricionais marginais, possivelmente porque nelas pode haver maior espaço para melhorias, pois as exigências dos frangos está mais distante de ser atendida.

Os resultados observados neste estudo contribuem para um maior conhecimento sobre a utilização de carboidrases em dietas milho-soja para frangos de corte, uma área em que os estudos ainda são recentes e escassos. Existe um grande caminho para investigar e desenvolver enzimas cada vez mais eficientes para os diferentes ingredientes usados na formulação de dietas para frangos de corte. Os reais mecanismos pelos quais as carboidrases aumentam o aproveitamento de nutrientes em ingredientes de alta digestibilidade, como o milho e o farelo de soja, e melhoram o desempenho zootécnico de frangos de corte, ainda precisam ser melhor elucidados.

Journal of Applied Poultry Research
Instructions to Authors

I. Scope and general information

A. Scope

The mission of The Journal of Applied Poultry Research (JAPR) is to provide practical, reliable, and timely information to those whose livelihoods are derived from the commercial production of poultry and those whose research benefits this sector; address topics of near-term application based on appropriately designed studies and critical observations; encourage scientific approaches to practical problem solving; and present information comprehensible to a broad readership. Opinions or views expressed in papers published by JAPR are those of the authors and do not necessarily represent the opinion of the Poultry Science Association or the editor-in-chief.

B. Submission

All manuscripts are submitted and reviewed via the journal's Scholar One Manuscripts submission site at <http://mc.manuscriptcentral.com/japr>. New authors should create an account prior to submitting a manuscript for consideration.

C. Contact information for journal staff

For information on the scientific content of the journal, contact the editor-in-chief, Dr. John Carey, Texas A&M University Department of Poultry Science, 101 Kleberg Center, 2472 TAMU, College Station, TX 77843-2472; e-mail: <mailto:jcarey@poultry.tamu.edu>. For assistance with ScholarOne Manuscripts and manuscript submission, contact David Busboom at david.busboom@poultryscience.org. For assistance with article proofs, copyright forms, published manuscripts, contact Matthew Marusak at <mailto:poultry.science@oup.com>. For assistance with invoicing, contact <mailto:production.invoicing@oup.com>.

D. Types of articles

i.) Research reports

Most papers published in JAPR are research reports. The journal emphasizes the importance of good scientific writing and clarity in presentation of the concepts, apparatus, and sufficient background information that would be required for thorough understanding by scientists in other disciplines. The results of experiments published in JAPR must be replicated, either by replicating treatments within experiments or by repeating experiments.

ii.) Field reports

Field reports will be published when adequate background is available and conclusions can be supported by quantifiable laboratory or diagnostic results. The manuscript should follow the format outlined in the Style and Form section of this document. It should include a section titled Field Report in which the observations are explained and discussed under subheadings of Materials and Methods and Results and Discussion. Authors are encouraged to include subheadings for all major areas in this section.

iii.) Review articles

Articles submitted to this section may cover new developments in a field, describe the evolution of a currently accepted management practice, propose changes in management based on current research, or describe procedures. Clear distinctions should be made between firmly established practices and unresolved questions. Articles should begin with a concise description of the topic, followed by a critical evaluation of the important references. Review articles, whether solicited or unsolicited, will be subject to a stringent review process. Review articles should follow the general format outlined in the Style and Form, when appropriate, and include brief subheadings to separate main ideas. A Conclusions and Applications section should be included in most cases.

iv.) Symposium and workshop articles

Manuscripts presented at the annual meeting as part of a symposium or workshop may be submitted with prior agreement by the editor-in-chief. These submissions will be subject to peer review and may be accepted or rejected in the same manner as other submissions. The format may be similar to reviews, research reports, or field reports, as outlined in the Style and Form.

v.) Letters and commentaries

The journal accepts letters, book reviews, and other free-form communications (used to correct errors, provide clarification, or offer other points of view on pertinent issues). Submissions may be edited in consultation with the author.

II. Journal Policies

A. Peer review process

The journal uses a two-stage review process. All manuscripts will first receive a preliminary review to ensure appropriateness for the journal. The second review will be a more detailed scrutiny by individuals knowledgeable in the specific subject area of the paper. Additional examination of the manuscript will be made by the editors. The review process will be stringent. Names of authors will be made known to reviewers; reviewers may contact the authors directly with questions, suggestions, and comments if such contact will improve the paper or streamline the review process. The subject editors will handle all initial correspondence with authors during the review process; the editor-in-chief will notify the author of the final decision to accept or reject.

B. Pre-review language editing If your first language is not English, to ensure that the academic content of your paper is fully understood by journal editors and reviewers, we recommend using an external language editing service. Language editing is optional and does not guarantee that your manuscript will be accepted for publication. For further information on this service, please [click here](#). Several specialist language editing companies offer similar services and you can also use any of these. Authors are liable for all costs associated with such services

C. Ethics Authors should observe high standards with respect to publication ethics as set out by the Commission on Publication Ethics (COPE). Falsification or fabrication of data, plagiarism, including duplicate publication of the authors' own work without proper citation, and misappropriation of the work are all unacceptable practices. Any cases of ethical misconduct are

treated very seriously and will be dealt with in accordance with the COPE guidelines. By submission of a manuscript, the authors guarantee to the journal that the work described has not been published before (except in the form of an abstract or as part of a published lecture, review, thesis, or dissertation); that it is not under consideration for publication elsewhere; and that its publication has been approved by all coauthors, if any, as well as by the responsible authorities at the institute where the work has been carried out. Appropriate identification of previously published preliminary reports should be provided in a title page footnote.

D. Care and use of animals

Authors must make it clear that experiments were conducted in a manner that avoided unnecessary discomfort to the animals by the use of proper management and laboratory techniques. Experiments shall be conducted in accordance with the principles and specific guidelines presented in Guide for the Care and Use of Agricultural Animals in Research and Teaching, 3rd edition, 2010; and, if applicable, Guide for the Care and Use of Laboratory Animals (United States Department of Human Health and Services, National Institutes of Health, Publication Number ISBN 0-309-05377-3, 1996); or Guide to the Care and Use of Experimental Animals, 2nd ed. Volume 1, 1993 (Canadian Council on Animal Care). Methods of killing experimental animals must be described in the text. In describing surgical procedures, the type and dosage of the anesthetic agent must be specified. Intra-abdominal and intrathoracic invasive surgery requires anesthesia. This includes caponization. The editor-in-chief of Poultry Science may refuse to publish manuscripts that are not compatible with these guides. If rejected solely on that basis, however, the paper may be resubmitted for reconsideration when accompanied by a written verification that a committee on animal care in research has approved the experimental design and procedures involved.

D. Third-party copyright

In order to reproduce any third party material, including tables, figures, or images, in an article authors must obtain permission from the copyright holder and be compliant with any requirements the copyright holder may have pertaining to this reuse. When seeking to reproduce any kind of third party material authors should request the following:

- i.) non-exclusive rights to reproduce the material in the specified article and journal;
- ii.) print and electronic rights, preferably for use in any form or medium;
- iii.) the right to use the material for the life of the work; and
- iv.) world-wide English-language rights. It is particularly important to clear permission for use in both the print and online versions of the journal, and we are not able to accept permissions which carry a time limit because we retain journal articles as part of our online journal archive.

E. Third-party content in Open Access papers

If you will be publishing your paper under an Open Access license but it contains material for which you do not have Open Access re-use permissions, please state this clearly by supplying the following credit line alongside the material:

Title of content

Author, Original publication, year of original publication, by permission of [rights holder]

G. Conflict of interest Oxford University Press requires declaration of any conflict of interest upon submission online. If the manuscript is published, conflict of interest information will be communicated in a statement in the published paper.

H. Permissions regarding reuses of OUP material

i.) Rights & Permissions

Global Business Development and Rights: At Oxford University Press (OUP), it is a core part of our objective to encourage the widest possible dissemination of our journal content. We offer a comprehensive suite of licensing services to meet the needs of institutions, pharmaceutical and healthcare companies, and publishers worldwide. Please see below for more information on the licensing options available.

ii.) Permissions

Permission for reuse or republication of Oxford Journals figures, abstracts, or articles, can be granted for a range of re-uses, including:

1. Republication in a book/ journal
2. eBook
3. PowerPoint presentation
4. Academic course packs
5. Thesis

The fastest and most efficient way to obtain permission to reuse Oxford Journals content is by using our Rightslink automated permissions system.

iii.) Oxford Open – Open Access

Articles published under our Oxford Open - Open Access model are clearly labeled, and made freely available online immediately upon publication, without subscription barriers to access. In addition, the majority of articles that are made available under Oxford Open, will also allow readers to reuse, republish, and distribute the article in a variety of ways, depending upon the license used. For further detail on Oxford Open and the activities permitted under our Open Access licenses, please click [here](#).

iv.) STM Permissions Guidelines and signatories A key part of our efforts to minimize the administration that is often involved in permission clearances while ensuring that any re-use of limited amounts of content from our journals is fair and the original source of the material fully attributed. It should be emphasized here that these are just guidelines.

v.) Rights and permissions guidelines for Authors

For details of our Publication Rights policies and obtaining third party permission please download our Guidelines for Author Permissions. Selfarchiving policies are specific to each journal, but details of these policies and their terms and conditions can be found on the journals' homepage.

vi.) Translation rights

1. Reprints Reprints are powerful promotional tools, not only at industry-specific exhibitions, conferences and meetings, but also for sales representatives and medical professionals in the field. Content Ed Net is OUP's current authorised provider for translated article reprints for the pharma industry. For more information on how to obtain translation reprints for your market/ territory, please contact us.

2. Local Excerpted editions

Local Editions provide an excellent opportunity to disseminate important research to healthcare professionals who may not otherwise have access to Oxford Journals content. OUP currently licenses Local Edition rights in more than a dozen territories across the globe. Publishing partners can select articles of interest to a specific market and distribute sponsored issues in the local language. For more information on our translation licensing activities, please contact us.

vii.) Business development – Digital licensing

OUP has an active digital licensing policy across our full range of journals and books. The Business Development group works to establish strategic partnerships and digital licensing relationships with companies all over the world. These activities are heavily focused on maximizing the dissemination, usage, and discoverability of Oxford content worldwide, while also incubating new business models and routes to market. To this end, the Business Development group licenses material into a wide range of digital platforms, including:

1. Online Aggregators
2. Mobile technologies
3. Discoverability services
4. Text Mining databases
5. Abstract and Indexing services
6. For more information or to discuss licensing OUP content, please contact us.

I. Self-archiving policy

i.) Author's original version

The author's original version is defined here as the un-refereed author version of an article that is considered by the author to be of sufficient quality to be submitted for formal peer review by a second party. The author accepts full responsibility for the article, which may have a version number or date stamp and the content and layout is set out by the author. Prior to acceptance for publication in the journal, authors retain the right to make their original version of the article available on their own personal website and/or that of their employer and/or in free public servers of original version articles in their subject area, provided that, upon acceptance, they acknowledge that the article has been accepted for publication as follows:

This article has been accepted for publication in [Journal Title] Published by Oxford University Press.

ii.) Version of record

The version of record is defined here as a fixed version of the journal article that has been made available by OUP by formally and exclusively declaring the article “published”. This includes any “early release” article that is formally identified as being published even before the compilation of a volume issue and assignment of associated metadata, as long as it is citable via some permanent identifier(s). This does not include any “early release” article that has not yet been “fixed” by processes that are still to be applied, such as copy-editing, proof corrections, layout, and typesetting. Authors of Oxford Open articles are entitled to deposit their original version or the version of record in institutional and/or centrally organized repositories and can make this publicly available immediately upon publication, provided that the journal and OUP are attributed as the original place of publication and that correct citation details are given. Authors should also deposit the URL of their published article, in addition to the PDF version. The journal strongly encourages Oxford Open authors to deposit the version of record instead of the original version. This will guarantee that the definitive version is readily available to those accessing your article from such repositories, and means that your article is more likely to be cited correctly. Oxford Journals automatically deposits open access articles in PMC for the majority of journals participating in Oxford Open. For a list of journals involved and for the latest information on the status of PMC deposits for individual journals please see journals which offer an open access model. In case of query please contact Journals Permissions.

J. Copyright

The Poultry Science Association, Inc. retains the copyright to all materials accepted for publication in the journal unless an Open Access license is selected. Authors will be asked to complete a Copyright Transfer Agreement following acceptance of their paper through the journal’s Author Services website.

K. Open Access

After your manuscript is accepted, the corresponding author will be required to complete a mandatory license to publish agreement. As part of the licensing process you will be asked to indicate whether or not you wish to pay for Open Access. If you do not select the open access option, your paper will be published with standard subscriptionbased access and you will only be charge page charges. JAPR authors have the option to publish their paper under the Oxford Open initiative; whereby, for a charge, their paper will be made freely available online immediately upon publication.

i.) Licenses RCUK/Wellcome Trust/COAF funded authors publishing in JAPR can use the Creative Commons Attribution license (CC BY) for their articles. All other authors may use a Creative Commons Non-Commercial license (CC BY-NC). Please click [here](#) for more information about Creative Commons licenses.

ii.) Charges

The Open Access charges are as follows:

1. PSA Members: \$1,500 (if at least one author is a current PSA member)
2. Standard charge: \$2,000
3. Reduced Rate Developing country charge*: \$1,000
4. Free Developing country charge*: \$0

Visit our developing countries page to view a list of qualifying countries. Authors can pay Open Access charges using our Author Services site. This will enable you to pay online with a credit/debit card, or request an invoice by email or mail. Please note that if an author elects to publish Open Access, page charges do not apply. However, Open Access charges are in addition to any color charges that may apply. Orders from the UK will be subject to the current UK VAT charge. For orders from the rest of the European Union, OUP will assume that the service is provided for business purposes. Please provide a VAT number for yourself or your institution, and ensure you account for your own local VAT correctly.

III. Preparation of manuscript

A. Manuscript format and structure/style

- i.) General Papers must be written in English. The text and all supporting materials must use American spelling and usage as given in The American Heritage Dictionary, Webster's Third New International Dictionary, or the Oxford American English Dictionary. Authors should follow the style and form recommended in Scientific Style and Format: The CSE Manual for Authors, Editors, and Publishers. 2006. 7th ed. Style Manual Committee, Council of Science Editors, Reston, VA.
- ii.) Preparing the manuscript file Manuscripts should be typed double-spaced, with lines and pages numbered consecutively, using Times New Roman font at 12 points. All special characters (e.g., Greek, math, symbols) should be inserted using the symbols palette available in this font. Complex math should be entered using MathType from Design Science (www.dessci.com). Tables and figures should be placed in separate sections at the end of the manuscript (not placed within the text). Metric or English units (or both) are acceptable. Authors should use units appropriate for the intended audience. Energy content of feeds will be expressed as calories.
- iii.) Headings
 1. Major headings Major headings are centered, boldface, in all capital letters, and consist of SUMMARY, DESCRIPTION OF PROBLEM, MATERIALS AND METHODS, RESULTS AND DISCUSSION, CONCLUSIONS AND APPLICATIONS, and REFERENCES AND NOTES. Major headings in review articles, field reports, and symposium articles may vary from those listed here, but should include SUMMARY, CONCLUSIONS AND APPLICATIONS, and REFERENCES AND NOTES.

2. First subheadings
First subheadings are boldface and italic, on a separate line beginning at the left margin, and have the first letter of each important word capitalized. Text that follows a first subheading should be in a new paragraph.
 3. Second subheadings
Second subheadings begin the first line of a paragraph. They are indented, boldface, italic, and followed by a period. The first letter of each important word is capitalized. The text follows immediately after the final period of the subheading.
- iv.) Title page
The title should be indicative of the content. It should capture the interest of all who might benefit from information in the manuscript. However, the length of the title should be kept to a minimum. The running title should be 30 characters or less, including spaces. Address and affiliation of authors (listed by first name or initials, middle initial, and last name) should be included. Indicate to whom correspondence should be directed by means of a footnote, with the notation "Corresponding author: (e-mail address)" at the bottom of the title page. List 3 to 8 key words or phrases to identify the most important subjects covered by the paper. Statement of primary audience. To determine appropriateness for the journal and to assist in selecting reviewers, the author should indicate clearly what sector(s) within the poultry community (e.g., flock supervisors, nutritionists, quality assurance personnel, researchers, plant managers, veterinarians) could benefit most from the content of this article.
 - v.) Summary
The Summary (maximum of 250 words) is not an abstract. It is intended to give readers with diverse backgrounds a general appreciation of the manuscript contents. It should be written so that even those not directly interested in the topic will enjoy reading at least this section to keep abreast of areas other than their own. This section should not include details of materials and methods or a detailed review of the results. Keep the summary free-flowing, giving the reader a general, not specific, idea of what the study revealed. Do not include reference citations in the summary.
 - vi.) Description of problem
This section will acquaint the reader with the problem, citing field experiences where appropriate. Readability is of utmost importance. Detailed literature reviews may not be appropriate for this section. A more extensive citation of references should be included in the Results and Discussion or References and Notes section. This section should end with a statement of the objective(s) of the study.
 - vii.) Materials and methods
The author(s) should clearly establish in the Materials and Methods section why the problem was approached in a particular way. The rationale for including each treatment should be clearly stated. Detailed laboratory and bird management procedures should be described in the References and Notes section and not in the Materials and Methods section. Sources of

stock, equipment, and materials should be listed in the References and Notes section and referred to in text by citation number. A brief statement of the statistical methods should be included, with more detailed descriptions placed in the References and Notes section. In manuscripts using several treatments, a description of treatments should be included as Table 1.

- viii.) Results and discussion This section begins with observed results and their interpretation. Descriptive subheadings may precede all major paragraphs and changes in subject emphasis. This section should discuss specifically how findings address the problem described in the Description of Problem section and how they are related to published works. Statements regarding statistically significant differences between treatments in results should be included in the text, tables, and figures. Statements regarding differences should be avoided unless they are supported by statistical analyses and meet the stated level of probability (e.g., $P < 0.05$).
- ix.) Conclusion and applications Conclusions and recommendations of the author(s) should be listed numerically. Each statement should be clear, concise, and without discussion. Authors are encouraged to summarize their significant findings, to identify further research needs, and to describe the constraints, economics, and other factors associated with using the results in scientific or commercial applications. Do not include references in this section.
- x.) References and notes (with Acknowledgements) References and notes should be cited in text, by number within an editorial bracket (e.g., [1]). In the References and Notes section, citations should be listed in the order they appear and are numbered in the text (not alphabetically). Authors are encouraged to use reference management software (e.g., EndNote or Reference Manager) to facilitate renumbering or inserting references by the editor or inserting references during the revision process. Manuscripts may be returned to authors before review for renumbering of references if not cited in numerical order. Include details such as statistical analysis; detailed procedures; sources of birds, instruments, or items; details of designed instruments; a literature review; and other tangential matters. Cite acknowledgments at the end of this section in a subsection called Acknowledgments. These entries are not numbered.
- xi.) Sample references

B. Tables

Number tables consecutively according to the citation in the text. Tables must be created using the Microsoft Word table feature and inserted in the manuscript after the references section. Each table must be placed on a separate page and must have a clear descriptive heading so that the meaning of the data will be understandable without reference to the text. Indicate footnotes to tables with numbers, beginning with 1. Statistical notation should be made with lowercase and uppercase superscript letters or with asterisks, as appropriate. Statistical notation should place the superscript "a" on the largest mean. Probability values may be indicated as follows: * $P \leq 0.05$, ** $P \leq 0.01$, *** $P \leq 0.001$, and † $P \leq 0.10$. Consult a recent issue of the journal for examples of tables.

C. Miscellaneous usage notes

i.) Abbreviations

The following abbreviations may be used without definition in JAPR. Plurals do not require "s." Chemical symbols and 3-letter abbreviations for amino acids do not need definition. Other abbreviations should be defined at first use in the summary and the main text, as well as in each table or figure in which they appear. Author-defined abbreviations are boldface at first use in the main text. Abbreviations should not be used in the manuscript title, running title, or to begin a paragraph or sentence. They can be used in section headings if previously defined. This list appears inside the back cover of each issue of the journal. The following abbreviations may be used without definition in JAPR:

ADF acid detergent fiber
ADFI average daily feed intake
ADG average daily gain
AME apparent metabolizable energy
AMEn nitrogen-corrected apparent metabolizable energy
ANOVA analysis of variance
AOAC Association of Official Analytical Chemists
BSA bovine serum albumin
BW body weight
°C Celsius
cDNA complementary DNA
CF crude fiber
cfu colony-forming units (following a numeral)
CI confidence interval
CP crude protein
cpm counts per minute
CV coefficient of variation
d day
df degrees of freedom
DM dry matter
DNA deoxyribonucleic acid
EDTA ethylenediaminetetraacetate
EE ether extract
ELISA enzyme-linked immunosorbent assay
°F Fahrenheit
FCR feed conversion ratio
FE feed efficiency
ft foot
g gram
gal gallon
G:F gain-to-feed ratio
GLM general linear model
h hour
HEPES N-(2-hydroxyethyl)piperazine-N'-2-ethanesulfonic acid
HPLC high-performance (high-pressure) liquid chromatography
ICU international chick units Ig immunoglobulin
IL interleukin

- ii.) SNP Nomenclature The increasing number of SNP association studies and the improvements in chicken genome annotation require a standardized SNP nomenclature for unequivocal and correct SNP identification. Additionally, information regarding the

SNP investigated should be easily accessible in a publicly available database. Therefore, all relevant SNP included in a study should be listed with their unique RefSNP (rs) or submitted SNP (ss) number (if rs number is not yet available) as indicated in the public domain NCBI dbSNP database (<http://www.ncbi.nlm.nih.gov/snp>). If the SNP investigated do not yet have an entry in the NCBI dbSNP database, the authors of the manuscript are responsible for submitting all the required information to NCBI (see <http://www.ncbi.nlm.nih.gov/projects/SNP/>) for depositing the SNP into this database and obtaining a unique ss number for the SNP. In the text of the manuscript, use of the rs/ss number of the SNP or an alternative standardized nomenclature is recommended.

D. Figures/Illustrations

i.) Permissions

All copyright permission must be cleared and, if necessary, paid for by the author; this includes applications and payments to DACS (Data Access Control System), ARS (Artists Rights Society), and similar licensing agencies where appropriate. It is also the author's responsibility to include acknowledgements as stipulated by particular institutions.

ii.) Requirements

Submission of figures in an electronic format will help us to ensure that your work is produced to the highest possible standard. This page contains information on how best to prepare your artwork for electronic submission. Most figure file formats are acceptable, although TIFF is preferable. TIFFs (Tagged Image File Format) are used for bitmap, greyscale, and colour images. To save files in TIFF format, go to the 'Save As' or 'Export' commands under 'File'. Before submitting artwork, please make sure that your image(s) fulfil the following criteria

iii.) Formats A number of different file formats are acceptable, including:

1. Tagged Image File Format (.tif)* (please check settings when exporting to Tiff from the original application).
2. Encapsulated PostScript (.eps)*
3. Rich Text Format (.rtf)
- 4.(Editable) Microsoft Word (.doc/.docx) (image files embedded into Word are often not good quality).
5. (Editable) Microsoft PowerPoint (.ppt/.pptx) (image files embedded into PowerPoint are often not good quality).
6. Microsoft Excel (.xls/.xlsx)
7. editable Portable Document Format (PDF)
8. Postscript (.ps)
9. Photoshop (.psd)
10. Adobe Illustrator (.ai)
11. Graphics Interchange Format (.gif)
12. Portable Network Graphics (.png) *preferred file format.

Note that .jpg is not a file format listed as files produced as

JPGs condense every time they are opened (and thus lose quality).

iv.) A note about resolution and quality: PPI vs. DPI

1. The quality of an image is not dependent upon DPI. Typically when an image is of low quality (even though the resolution is within standards), the image contains pixelated text. This means that the figure should be redrawn using a standard font and that care should be taken to ensure the font is embedded.
2. DPI pertains to the print version of the image; PPI to the online version. The compositor will take care to convert the accepted figure files accordingly. It is important to note that maximum size should be set at 1081 width by 1280 height for PPI / 600 DPI for line drawings and a minimum 300 DPI for colour or tone images.
3. Graphics downloaded from the Web are not acceptable for print reproduction. These graphics are low-resolution images (usually 72 dpi) that are suitable for screen display but far below acceptable standards for print reproduction.
4. Please take care that images you supply are not simply low resolution figures that have been expanded. These types of images will appear pixelated when maximised.

v.) Specific types of artwork

1. Bar graphs
Avoid the use of gray or color in bar graphs. Instead, please use solid black, solid white, and patterned (e.g., horizontally or diagonally striped) bars.
2. Line art
Line art is best reproduced when it is submitted as crisp black-and-white images and contains no unnecessary gray shading.
3. Patterns
If your image requires the use of many lines (as line graphs often do), please choose patterns that are easily distinguished from each other. Patterns with similar characteristics are hard to differentiate after reduction. For additional useful information on preparing your figures for publication, go to <http://cpc.cadmus.com/da>.
4. Equations and tables
All equations to be formatted using MathType only; image versions should be avoided. All tables to be in editable format in either Word or Excel; image and pdf versions should be avoided.

vi.) Requirements

Follow these rules for figures:

1. Number them consecutively following the sequence in which they are mentioned in the text.

2. Include scale bars where appropriate. These should not be placed in the legend.

3. Size figures for publication:

| Design | Page size | N ^o of columns | Required figure processing width | |
|---------------|--------------|---------------------------|----------------------------------|---------------|
| | | | Single column | Double column |
| Large format | 279 x 216 mm | Double | 90 mm | 180 mm |
| Medium format | 246 x 189 mm | Double | 80 mm | 160 mm |
| Small format | 234 x 156 mm | Single | 130 mm | |

4. Figures must:

- Be submitted for publication at resolutions of 600 dots per inch for line figures/black&white images and 300 dots per inch for half tones/color figures.
- Use the same font type for all figures; use standard fonts such as Times, Courier, Arial, Helvetica, or Symbol. • Have embedded fonts. Embedding the fonts ensures that the text is retained within the figure during production.
- Have uniform lettering style and ensure that figure locants are consistently sized throughout. Figures will not be redrawn by the publisher.
- Have legends that define abbreviations and contain enough information so the figure can be understood independently of the text. Legends should be listed one after the other at the end of the main text document.
- Be converted to grayscale if originally created in color but intended to be printed in black and white BEFORE acceptance.
- Be saved in a separate file.
- Always use the latest version of the software program available. Files from older versions often lose integrity when opened in newer versions.
- Have layers flattened into one layer, if using any files consisting of layers (e.g., .eps).
- Be saved as clearly named files so that they can easily be identified in terms of manuscript, figure number, and format (e.g. [first author surname]Fig1.tif).
- Have figure legends/captions included at the end of the main text file. Please ensure that figures and figure legends/captions are in agreement. Symbols must NOT be included in figure legends; ALL symbols used in figures should be described in the legend/caption using words (e.g., filled triangle, open circle). Symbols may be used in the key within the figure artwork.

- Have line weights between 0.35 pt and 1.5 pt; if there are multiple lines in use, use patterns to differentiate them. Do not use lines that are thinner than 2 points, including the “hairline” width option in some programs.
- Have colour supplied in CMYK and not RGB. Please note that the use of red and green in figures is particularly problematic for approximately 5% of the male population. Advice on the preparation of colour-friendly figures is provided at:
http://ifly.iam.utokyo.ac.jp/html/manuals/pdf/color_blind.pdf.
- Have all data included within the illustration area.
- Avoid placing labels over a shaded area of the image.

E. Supplementary data

Submit all material to be considered as Supplementary Material online at the same time as the main manuscript. Ensure that the supplementary material is referred to in the main manuscript at an appropriate point in the text. Supplementary material will be available online only and will not be copyedited, so ensure that it is clearly and succinctly presented, and that the style conforms to the rest of the paper. Also ensure that the presentation will work on any Internet browser. It is not recommended for the files to be more than 2 MB each, although exceptions can be made at the editorial office’s discretion.

IV. Charges

A. Open Access charges

After your manuscript is accepted, the corresponding author will be required to complete a mandatory license to publish agreement. As part of the licensing process you will be asked to indicate whether or not you wish to pay for Open Access. If you do not select the open access option, your paper will be published with standard subscription-based access and you will only be charge page charges. JAPR authors have the option to publish their paper under the Oxford Open initiative; whereby, for a charge, their paper will be made freely available online immediately upon publication.

i.) Licenses RCUK/Wellcome Trust/COAF funded authors publishing in JAPR can use the Creative Commons Attribution license (CC BY) for their articles. All other authors may use a Creative Commons Non-Commercial license (CC BY-NC).

ii.) Charges The Open Access charges are as follows:

1. PSA Members: \$1,500 (if at least one author is a current PSA member)
2. Standard charge: \$2,000
3. Reduced Rate Developing country charge*: \$1,000
4. Free Developing country charge*: \$0 *Visit our developing countries page to view a list of qualifying countries.

Authors can pay Open Access charges using our Author Services site. This will enable you to pay online with a credit/debit card, or request an invoice by email or mail. Please note that if an author elects to publish Open Access, page charges do not apply. However, Open Access charges are in addition to any color charges that may apply. Orders from the UK will be subject to the current UK VAT

charge. For orders from the rest of the European Union, OUP will assume that the service is provided for business purposes. Please provide a VAT number for yourself or your institution, and ensure you account for your own local VAT correctly.

B. Conventional page charges

The current charge for publication is \$60 per printed page (or fraction thereof) in the journal if at least one author is a professional member of PSA. If no author is a member of PSA, the publication charge is \$85 per journal page. The corresponding author shall be financially responsible for insuring payment of relevant page charges in a timely manner. The Editorial Office reserves the right to deny further publication to the corresponding author until such time as payment is received. Waivers of page charges must be requested in advance of submission and will only be considered from authors from the approved list of developing countries.

C. Color charges

The cost to publish in color in the print journal is \$600 per color image. Color versions of figures will be included in the online PDF and full-text article at no charge.

V. Additional information about accepted manuscripts

A. Charges

For charges relating to publication in JAPR please access <https://academic.oup.com/japr/>

B. Proofs

Authors will receive a link to the PDF proof of their manuscript on our online system by email, and it is essential that a current email address is supplied with all manuscripts. Proofing instructions will accompany the PDF file but the proof should be checked immediately upon receipt and uploaded in accordance with covering instructions. Only essential corrections should be made at the proof stage.

C. Advance access For JAPR, manuscripts arrive at OUP and go through the production process until the final versions are ready to publish. These are then published on the journal's Advance Access page: <http://japr.oxfordjournals.org/content/early/recent>. They will remain on the page up until the issue that they are assigned to is published.

D. Offprints

All contributors of published articles will have free online access to the PDF and HTML version of their article, to which links can be created from an institutional or firm website. Authors of accepted articles can order paper offprints during the publication process. All authors are sent an individual link (after acceptance) to the Author Services site, where they are able to order offprints and single issues.

E. CrossRef Funding Data registry In order to meet your funding requirements authors are required to name their funding sources, or state if there are none, during the submission process. For further information on this process or to find out more about the CHORUS initiative please access https://academic.oup.com/journals/pages/open_access/funder_policies/chorus

VITA

Heitor Vieira Rios, filho de Jayme Oliveira Rios e Luiza Helena Bergallo Vieira Rios, nascido em 17 de dezembro de 1990, em Porto Alegre – RS. Completou o ensino fundamental e o ensino médio no Colégio Anchieta localizado na cidade de Porto Alegre - RS em 2007. Em 2008 ingressou no curso de Medicina Veterinária na Universidade Federal do Rio Grande do Sul. Em 2011 trancou a faculdade para realizar curso de inglês na Austrália. No último semestre da faculdade foi Estagiário Nível Superior na BRF, em Lajeado, na área de avicultura sob supervisão de Débora Leal. Formou-se Médico Veterinário em dezembro de 2014. No primeiro semestre de 2015 ingressou em primeiro lugar na seleção no Programa de Pós Graduação em Zootecnia da UFRGS, sob orientação do professor PhD. Sergio Luiz Vieira. Recebeu o prêmio de Menção Honrosa na área de Nutrição na Conferência Facta 2015 com o trabalho intitulado “Aproveitamento da energia em frangos de corte alimentados com dietas suplementadas com níveis crescentes de amilase e formuladas com fitase”. Em 2016, recebeu o prêmio José Maria Lamas na Conferência Facta, também na área de nutrição, com o trabalho intitulado “Desempenho e utilização da energia de frangos alimentados com dietas suplementadas com um complexo enzimático”. Foi submetido à banca de defesa de Dissertação em fevereiro de 2017.
